

CAPSTONE PROPOSAL

Building a Company Brain using MCP

PROJECT IDEATION

Stop selling software to the team. Become the team.

THE SPARK

A tweet from Andrej Karpathy.

He started using LLMs to build personal knowledge bases for his research interests — shifting his token budget from manipulating code to manipulating knowledge.

OUR REFRAME

If a knowledge base works for **one person**, what would it take to build one for an entire **company**?

A SCENE FROM 2026

The model is ready. The company isn't.

THE ASK

A 40-person logistics company spends ₹2L/month on outsourced finance. Founder asks: can an agent just do this instead?

THE BLOCKER

Nobody has written down how this company actually works. Net-30 vs net-60. What counts as a duplicate. Who approves >₹50k.

THE RESULT

The agent guesses. And an agent that guesses about money is worse than no agent at all.

Operating knowledge is **scattered** — and that is the real problem.

01

Slack
threads

02

Email chains

03

Spreadsheets

04

Tickets &
SOPs

05

Internal
databases

06

**People's
heads**

Humans navigate the mess by intuition. Agents cannot. What is missing is a layer in between — a living, executable map of how a specific company works.

**That layer is
the Company Brain.**

A knowledge base answers questions. A brain makes decisions.

KNOWLEDGE BASE

Retrieval.

Tells the agent where the refund policy is written. Returns documents. Stops at search.

COMPANY BRAIN

Encoded judgment.

Tells the agent that **this** refund, for **this** customer, at **this** amount, is approved — or needs the founder.

Serverless global edge **knowledge routing** pipeline

PROTOCOL LAYER

Model Context Protocol (MCP) running over Streamable HTTP.

CORE STACK

Cloudflare Workers paired with high-performance Cloudflare KV edge key-value storage bindings.

STATEFUL SESSIONS

Durable Objects give every connected Claude session its own isolated stateful instance.

SECURITY LAYER

Corporate endpoints gated via Google OAuth verification through Cloudflare Access.

ARCHITECTURE IN ONE LINE

Local Obsidian Vault

.md files

node sync.js engine

Cloudflare KV Namespace

Cloudflare Worker

MCP host server

Claude Client App

Local Obsidian vault structure & ingestion layer

Knowledge lives in plain, portable markdown files — synchronised to the edge through a custom `sync.js` framework.

01 Root directives

CLAUDE.md is the core schema — folder configs, page-naming templates, and cross-referencing rules that govern LLM behaviour.

02 Intake layer

`sources/raw/` and `sources/clippings/` capture web clips and raw operational transcripts securely.

03 Core memory

`concepts/` and `entities/` track technical entities, master workflows, tools, and team roles.

04 Aggregation layer

`synthesis/` maps multi-source cross-references into unique corporate knowledge hubs.

Production API connectors exposed over the **Worker endpoint**

`get_index`

Returns the complete catalog of wiki pages grouped by category for quick agent orientation loops.

`get_page`

Fetches the complete raw markdown content of a single page by its matching KV key.

`search_wiki`

Executes full-text search across all pages to extract real-time context excerpts.

`get_overview`

Returns the high-level operational summary and identifies every active data domain.

`list_pages`

Lists page titles across the directory trees — a lighter payload than `get_index`.

`visualize`

Generates live Mermaid diagrams straight from the wiki's context maps.

This work has a right answer. So we measure it.

EVALS		GUARDRAILS	
Golden set of real cases	50+ invoices	Agent decides	clean matches
Hard cases included	edge / exception	Hands back to human	mismatches, >₹50k
Loop: fail → fix brain → re-run	documented	Forbidden, always	no payments

Proof is not architecture. Proof is real work, signed off.

WHAT WE SHIP BY 7 JUNE 2026

The brain

Operating map, skills, rules, exceptions — the structured artefact.

Live agent

Reconciling 10 real invoices end-to-end via MCP.

Eval log

One failure, the brain edit that fixed it, and the case passing after.

Founder sign-off

A real operator confirming the work was done correctly.

Stop selling software to the team. **Become the team.**
